-!- FUNCTION: CYTOCHROME C OXIDASE IS THE COMPONENT OF THE RESPIRATORY CHAIN THAT CATALYZES THE REDUCTION OF OXYEGEN TO WATER. SUBUNITS 1-3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX. CO I IS THE CATALYTIC SUBUNIT OF THE ENZYME. ELECTRONS ORIGINATING IN CYTOCHROME C ARE TRANSFERRED VIA THE COPPER A CENTER OF SUBUNIT 2 AND HEME A OF SUBUNIT 1 TO THE BIMETALLIC CENTER FORMED BY HEME A3 AND COPPER B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4 FERRICYTOCHROME C.
-!- PATHWAY: TERMINAL STEP IN THE RESPIRATORY CHAIN.
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. MITOCHONDRIAL
-!- INNER MEMBRANE. CONTAINS 12, EDTENTIAL TRANSMEMBRANE DOMAINS.
-!- SIMILARITY: BELONGS TO THE HEME-COPPER RESPIRATORY OXIDASE FAMILY.

-! FUNCTION EVYOCHROWE COXIDASE IS THE COMPONENT OF THE RESPIRATORY
CHAIN THAT CATALYZES THE REDUCTION OF OXYGEN TO WATER. SUBGNITS 1-
3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX. CO I IS THE
CATALYTIC SUBUNIT OF THE ENXYME. ELECTRONS ORIGINATING IN
CYTOCHROME C ARE TRANSFERRED VIA THE COPPER A CENTER OF SUBUNIT 2
AND HEME A OF SUBUNIT 1 TO THE BINETALLIC CENTER FORMED BY HEME AS
AND COPPER B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4 FERRICYTOCHROME C.
PATHWAY: TERMINAL STEP IN THE RESPIRATORY CHAIN.
SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN: MITOCHONDRIAL
INNER MEMBRANE. CONTAINS 12 POTENTIAL TRANSMEMBRANE DOMAINS.
SIMILARITY: BELONGS TO THE HEME-COPPER RESPIRATORY OXIDASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

-- FUNCTION: CYTOCHROME C OXIDASE IS THE COMPONENT OF THE RESPIRATORY

CHAIN THAT CATALYZES THE REDUCTION OF OXYGEN TO WATER. SUBUNITS 1-

3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX. CO I IS THE

CATALYTIC SUBUNIT OF THE ENZYME. ELECTRONS ORIGINATING IN

CYTOCHROME C ARE TRANSFERED VIA THE COPPER A CENTER OF SUBUNIT 2

AND HEME A OF SUBUNIT 1 TO THE BIMETALLIC CENTER FORMED BY HEME A3

```
The present invention is directed to a polynucleotide carrying the regulatory expression signals of the ESAT-6 protein as well as an open regulatory expression signals of the ESAT-6 protein as well as an open reading frame coding for an antigenic protein LHP from Mycobacterium tuberculosis. Host cells comprising the polynucleotide are used for the recombinant expression of the protein. The recombinant polypeptide can be used as immunogens and vaccines, to protect against bacteria of the W. tuberculosis complex in humans or animals (the vaccines may include other immunogenic proteins of the bacteria or their fragments, specifically ESAT-6; and (b) for diagnosing tuberculosis infection by catection of specific antibodies. The regulatory region present in the polynucleotide may be used to express almost any heterologous protein in mycobacteria, particularly as a fusion with polyhistidine. The two provide a synergistic increase lampability to induce a protective immune response. Sequences AAY03706-713 tepresent antigenic fragments of the

Mycobacterium for expression New nucleic acid containing regulator and LHP gene of tuberculosis - useful in vaccines, for diagnosis, and of heterologous proteins

Claim 21; Page 64; 88pp; English.

The present invention is directed to a polynucleotide carrying the regulatory expression signals of the ESAT-6 protein as well as an open reading frame coding for an antigenic protein LHP from Mycobacterium tuberculosis. Host cells comprising the polynucleotide are used for the

```
be used as immunogens and vaccines, to protect against bacteria of the with the vaccines may include other immunogenic proteins of the bacteria or their fragments, specifically ESAT-6); and (b) for diagnosing tuberculosis infection by detection of specific antibodies. The regulatory region present in the polynucleotide may be used to express almost any heterologous protein in mycobacteria, particularly as a fusion with polyhistidine. The two proteins encoded by the polynucleotide, the and ESAT-6, are expected to provide a synergistic increase in ability to induce a protective immune response. Sequences AAY03706-713 represent antigenic fragments of the
                                                     polypeptide can
recombinant expression of the protein. The recombinant be used as immunores and waring.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polypeptide.

New immunogenic polypeptide(s) from Mycobacterium tuberculosis - are useful in vaccines for prevention or treatment of tuberculosis, also for diagnosis

Example 3; Page 149; 168pp; English.

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, PBS-8-1F3. The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins blus ESAT-6, are useful in vaccines, preferably when formulated with a

This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - use to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tuberculosis; infection; diagnosis; antigen; Tb38-1F3.

The present sequence represents a M.tuberculosis antigen, Tb38-IP3. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's, DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion tuberculosis-immune subjects. AAX19294 to AAX19460 and AAX39083 to AAX39225 are used in the exemplification of the present invention.
                                                                                                                                                                        New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antigen; diagnosis; detection; infection; antibody; immunisation;

                                                                                                                                                                                                                                                                                                                                                                        This polypeptide comprises Mycobacterium tuberculosis antigen Tb38-1F3. A DNA molecule (see AAV44400) coding for Tb38-1F3 was isolated from a M. tuberculosis strain H37Kv genomic library. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigent portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis
                                                                                                                                                                                                                                                                                      New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mycobacterium tuberculosis; M. tuberculosis; antigen; immunogen; immunotherapy; diagnosis; immunisation; vaccine; infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Óλ
                                                                                                                                                                                                  ó:
                                             invention describes novel recombinant antigens and their encoding
                                                       nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the Polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or andifications). The present sequence represents a M.tuberculosis antigen, Tb38-1. The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins preferably when formulated with a non-specific adjuvant, to induce an immune response against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tuberculosis - are

The present sequence represents a M.tuberculosis antigen, Tb38-1. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                New immunogenic polypeptide(s) from soluble M. tuberculosis antigens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

This is an antigenic portion of Mycobacterium tuberculosis antigen TD38-1. A DNA sequence (see AAV44384) coding for antigen TD38-1. A DNA sequence (see AAV44384) coding for antigen TD38-1 was isolated from a M. tuberculosis strain HJRV expression library using sera from patients having pulmonary or pleural tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AMA4291-M46479) comprising an antigenic portion of as soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, contibodies or oligonucleotide probes and primers, for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                     New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducting protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion tuberculosis-immune subjects. AAX19249 to AAX19460 and AAX39083 to AAX39225 are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel recombinant antigens and their encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in biological sample by detecting antibodies which bind with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 detection; infection; antibody; immunisation;

                                                                                                                                                                                                                                                                         TD38-1. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens such as TD38-1, e.g. TDF-2 (see AAY32063) and a TDH9-TD38-1 fusion. The new fusion proteins are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mycobacterium tuberculosis; M. tuberculosis; antigen; immunogen; immunotherapy; diagnosis; immunisation; vaccine; infection; immune response; skin test.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Nylternate names: hypothetical protein P-10
C;Species: Chlamydia trachomatis
08-0ct-1999
C;Accession: S01924; S00794
R;Comanducci, M.; Ricci, S.; Ratti, G.
MOI. Microbiol. 2, 531-538, 1988
A;Title: The structure of a plasmid of Chlamydia trachomatis believed to be required for A;Reference number: S01920; MUID:89013895
